## Remarks

Notes: Refusal at 1.7m on unknown obstruction.0 - 0.7m plain pipe, 0.7 - 1.7m slotted pipe. 0.0-0.6m bentonite; 0.9-1.7m gravel.

## Appendix 4 Field Methods

In the preparation of this report Ramboll has made reference to UK regulatory guidance and methodologies, including, but not limited to: Land Contamination: Risk Management<sup>7</sup> (LCRM); BS5930:2015+A1:2020 Code of Practice for site Investigation<sup>8</sup>; and BS10175:2011 + A2:2017 Code of Practice for the Investigation of Potentially Contaminated Sites<sup>9</sup>.

This section refers to work undertaken by Ramboll only.

### **Investigatory Locations**

Investigatory locations were marked out and cleared by a specialist underground service clearance contractor before the start of intrusive works, in accordance with Ramboll's Health and Safety procedures. Supervision of drilling works was undertaken by a professional engineer, who logged the soil arisings, collected samples and completed in-situ testing;

Where boreholes were drilled, these were undertaken to facilitate the collection of shallow and deeper soil and groundwater samples. Selected boreholes were installed with monitoring wells for assessment of ground gas and, where present groundwater conditions .

Trial pits were excavated using a mechanical excavator to facilitate the collection of shallow soil samples and allow the assessment of ground conditions for environmental purposes;

Hand dug pits were dug, to facilitate the collection of shallow soil samples and allow the assessment of ground conditions for environmental purposes.

### **Sampling**

Samples of various environmental media were collected in accordance with BS 10175.

Samples and were stored within appropriate sample containers and forwarded to an independent analytical laboratory. Samples were placed in containers supplied by the laboratory appropriate to the type of analysis being undertaken and stored in cool boxes with ice packs. All samples were dispatched accompanied by chain of custody documentation. The laboratory selected to perform the analysis is accredited by UKAS to ISO 17025. Internal quality assurance checks are carried out by the laboratory data prior to the laboratory certificates being issued.

Each of the monitoring/sampling wells that were constructed were developed on completion. Prior to sampling, the depth to the resting groundwater level (where present) and base of the monitoring wells were measured using an electronic interface probe, wells were then purged before samples were taken.

### **Testing**

Where soil samples were tested on site for volatile organic compounds (VOCs), testing was completed using a photo-ionisation detector (PID). Each sample was placed into a sealed plastic bag and agitated. The PID was then inserted into the headspace and the total VOC reading recorded. The PID screens for a wide range of VOCs but does not indicate a specific compound; therefore, the results of the PID screening provide a semi-quantitative indication of the concentration of VOCs present in soil pore spaces.

Where relevant testing was undertaken by the laboratory to MCerts standards. Selected samples were scheduled for analysis for a suite of contaminants designed to be reflective of the site's

<sup>7</sup> Environment Agency (2020) Land Contamination: Risk Management

<sup>8</sup> British Standards (2015) Code of Practice for site Investigation BS5930:2015+A1:2020

historical and contemporary uses, and specifically to investigate the PCLs identified in the PRA (as listed in Section 0).

### **Monitoring**

Wells were of appropriate construction for the ground conditions encountered. The well designs are detailed within the appended borehole logs.

Ground gas monitoring was completed using a calibrated monitor. The following parameters were measured:

- Methane (% vol);
- Carbon dioxide (% vol);
- Oxygen (% vol);
- Carbon Monoxide (ppm);
- Hydrogen Sulphide (ppm); and
- Flow rate (l/hr).

Gas flow rates were measured at all monitoring boreholes and the range in flow rates and concentrations were recorded until a steady state was reached or for at least three minute.

## Appendix 5

### Laboratory Testing Results – Summary Tables

| Risks to Groundwater                    |                         |       |        |            | Sample ID            |                     | WS2           | WS3           |
