**Date :** 18th March, 2024  
**Your reference :** 1620016166-002  
**Our reference :** Test Report 24/3334 Batch 1 24/3398 Batch 1  
**Location :** Manor Farm  
**Date samples received :**  
**Status :** Final Report  
**Issue :** 202403181413

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 47.06 kg of CO2

Scope 1&2&3 emissions - 111.215 kg of CO2

**Authorised By:**

**Paul Boden BSc**  
Senior Project Manager

## Element Materials Technology

### Notification of Deviating Samples

|                     |                |
|---------------------|----------------|
| <b>Client Name:</b> | Ramboll        |
| <b>Reference:</b>   | 1620016166-002 |
| <b>Location:</b>    | Manor Farm     |
| <b>Contact:</b>     | Eleanor Brown  |

**Matrix : Liquid**

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/3334 24/3398

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 37°C ±5°C.

Where Mineral Oil or Fats, Oils and Grease is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil or Fats, Oils and Grease is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| AD      | Samples are dried at 35°C ±5°C                                                                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |
| BS      | AQC Sample                                                                                                                                                               |
| LB      | Blank Sample                                                                                                                                                             |
| N       | Client Sample                                                                                                                                                            |
| TB      | Trip Blank Sample                                                                                                                                                        |
| OC      | Outside Calibration Range                                                                                                                                                |
| AA      | x2 Dilution                                                                                                                                                              |
| AB      | x3 Dilution                                                                                                                                                              |
| AC      | x5 Dilution                                                                                                                                                              |
| AD      | x7 Dilution                                                                                                                                                              |
| AE      | x10 Dilution                                                                                                                                                             |
| AF      | x20 Dilution                                                                                                                                                             |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

EMT Job No: 24/3334 24/3398

| Test Method No. | Description                                                                                                                                                                                                        | Prep Method No. (if appropriate) | Description                                                                                                                                                       | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |

| Test Method No. | Description                                                                                                                                                                                                                  | Prep Method No. (if appropriate) | Description                                                                                                             | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------|------------------------|-------------------------------------------------|------------------------------|
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1. | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                    | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                    | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM76            | Modified US EPA method 120.1 (1982). Determination of Specific Conductance by Metrohm automated probe analyser.                                                                                                              | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                       | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                     | PM121                            | Preparation of PFAS liquid samples – As received samples are centrifuged and the supernatant is used for PFAS analysis. |                       |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                     | PM122                            | SPE Preparation of Water Samples for PFAS analysis by LC-MS/MS                                                          |                       |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                     | PM122                            | SPE Preparation of Water Samples for PFAS analysis by LC-MS/MS                                                          | Yes                   |                        |                                                 |                              |
| TM149           | Determination of Pesticides by Large Volume Injection on GC Triple Quad MS, based upon USEPA method 8270D v5:2014                                                                                                            | PM30                             | Water samples are extracted with solvent using a magnetic stirrer to create a vortex.                                   |                       |                        |                                                 |                              |
| TM176           | Free ammonia based on the pH and temperature dependent equilibrium calculated in accordance with NRA Water Quality Objectives 1994 using the ammoniacal nitrogen result.                                                     | PM0                              | No preparation is required.                                                                                             |                       |                        |                                                 |                              |

**Your reference :** 1620016166-002  
**Our reference :** Test Report 24/3461 Batch 1  
**Location :** Manor Farm  
**Date samples received :** 29th February, 2024  
**Status :** Final Report  
**Issue :** 202403181423

Five samples were received for analysis on 29th February, 2024 of which five were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 22.299 kg of CO2

Scope 1&2&3 emissions - 52.699 kg of CO2

## Element Materials Technology

Client Name: Ramboll  
Reference: 1620016166-002  
Location: Manor Farm  
Contact: Eleanor Brown  
EMT Job No: 24/3461

Report : Liquid

Liquids/products: V=40ml vial, G=glass bottle, P=plastic bottle  
H=H<sub>2</sub>SO<sub>4</sub>, Z=ZnAc, N=NaOH, HN=HNO<sub>3</sub>

### Notification of Deviating Samples

**Matrix : Liquid**

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/3461

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 37°C ±5°C.

Where Mineral Oil or Fats, Oils and Grease is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil or Fats, Oils and Grease is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| AD      | Samples are dried at 35°C ±5°C                                                                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |
| BS      | AQC Sample                                                                                                                                                               |
| LB      | Blank Sample                                                                                                                                                             |
| N       | Client Sample                                                                                                                                                            |
| TB      | Trip Blank Sample                                                                                                                                                        |
| OC      | Outside Calibration Range                                                                                                                                                |
| AA      | x2 Dilution                                                                                                                                                              |
| AB      | x3 Dilution                                                                                                                                                              |
| AC      | x5 Dilution                                                                                                                                                              |
| AD      | x6 Dilution                                                                                                                                                              |
| AE      | x10 Dilution                                                                                                                                                             |
| AF      | x30 Dilution                                                                                                                                                             |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

| Test Method No. | Description                                                                                                                                                                                                                  | Prep Method No. (if appropriate) | Description                                                                                                             | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------|------------------------|-------------------------------------------------|------------------------------|
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1. | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                    | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                    | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM76            | Modified US EPA method 120.1 (1982). Determination of Specific Conductance by Metrohm automated probe analyser.                                                                                                              | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                       | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                     | PM121                            | Preparation of PFAS liquid samples – As received samples are centrifuged and the supernatant is used for PFAS analysis. |                       |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                     | PM122                            | SPE Preparation of Water Samples for PFAS analysis by LC-MS/MS                                                          |                       |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                     | PM122                            | SPE Preparation of Water Samples for PFAS analysis by LC-MS/MS                                                          | Yes                   |                        |                                                 |                              |
| TM149           | Determination of Pesticides by Large Volume Injection on GC Triple Quad MS, based upon USEPA method 8270D v5:2014                                                                                                            | PM30                             | Water samples are extracted with solvent using a magnetic stirrer to create a vortex.                                   |                       |                        |                                                 |                              |
| TM176           | Free ammonia based on the pH and temperature dependent equilibrium calculated in accordance with NRA Water Quality Objectives 1994 using the ammoniacal nitrogen result.                                                     | PM0                              | No preparation is required.                                                                                             |                       |                        |                                                 |                              |

We received 4 samples on Friday March 01, 2024 and 4 of these samples were scheduled for analysis which was completed on Thursday March 07, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

## Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH<sub>4</sub> by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEX). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

## General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

### 19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

|   |                                                                             |
|---|-----------------------------------------------------------------------------|
| 1 | Container with Headspace provided for volatiles analysis                    |

| @ | Sample holding time exceeded due to late arrival of instructions or samples |
| § | Sampled on date not provided                                                |

### 20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

#### Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

| Asbestos Type         | Common Name    |
|-----------------------|----------------|
| Chrysotile            | White Asbestos |
| Amosite               | Brown Asbestos |
| Crocidolite           | Blue Asbestos  |
| Fibrous Actinolite    | -              |
| Fibrous Anthophyllite | -              |
| Fibrous Tremolite     | -              |

#### Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

#### Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

**Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.**

**The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.**

We received 3 samples on Tuesday March 05, 2024 and 3 of these samples were scheduled for analysis which was completed on Monday March 11, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

## Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH<sub>4</sub> by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEx). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

## General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

### 19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

|   |                                                                             |
|---|-----------------------------------------------------------------------------|
| 1 | Container with Headspace provided for volatiles analysis                    |
| 2 | Incorrect container received                                                |
| 3 | Deviation from method                                                       |
| 4 | Matrix interference                                                         |
| ♦ | Sample holding time exceeded in laboratory                                  |
| @ | Sample holding time exceeded due to late arrival of instructions or samples |
| § | Sampled on date not provided                                                |

### 20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

#### Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

| Asbestos Type         | Common Name    |
|-----------------------|----------------|
| Chrysotile            | White Asbestos |
| Amosite               | Brown Asbestos |
| Crocidolite           | Blue Asbestos  |
| Fibrous Actinolite    | -              |
| Fibrous Anthophyllite | -              |
| Fibrous Tremolite     | -              |

#### Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

#### Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

**Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.**

**The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.**

**Your reference :** 1620016166-002  
**Our reference :** Test Report 24/6046 Batch 1 Schedule A 24/6046 Batch 1 Schedule C 24/6046 Batch  
**Location :** Manor Farm  
**Date samples received :** 10th April, 2024  
**Status :** Final Report  
**Issue :** 202404261517

Seven samples were received for analysis on 10th April, 2024 of which seven were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 30.336 kg of CO2

Scope 1&2&3 emissions - 71.691 kg of CO2

## Element Materials Technology

### Notification of Deviating Samples

|                     |                |
|---------------------|----------------|
| <b>Client Name:</b> | Ramboll        |
| <b>Reference:</b>   | 1620016166-002 |
| <b>Location:</b>    | Manor Farm     |
| <b>Contact:</b>     | Eleanor Brown  |

**Matrix : Liquid**

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/6046

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |
| BS      | AQC Sample                                                                                                                                                               |
| LB      | Blank Sample                                                                                                                                                             |
| N       | Client Sample                                                                                                                                                            |
| TB      | Trip Blank Sample                                                                                                                                                        |
| OC      | Outside Calibration Range                                                                                                                                                |
|         |                                                                                                                                                                          |
| AA      | x2 Dilution                                                                                                                                                              |
| AB      | x5 Dilution                                                                                                                                                              |
| AC      | x6 Dilution                                                                                                                                                              |
| AD      | x8 Dilution                                                                                                                                                              |
| AE      | x10 Dilution                                                                                                                                                             |

# HWOL ACRONYMS AND OPERATORS USED

**Attention :** Eleanor Brown  
**Date :** 29th April, 2024  
**Your reference :** 1620016166-002  
**Our reference :** Test Report 24/6046 Batch 1 Schedule B  
**Location :** Manor Farm  
**Date samples received :** 10th April, 2024  
**Status :** Final Report  
**Issue :** 202404291420

Seven samples were received for analysis on 10th April, 2024 of which five were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 0.724 kg of CO2

Scope 1&2&3 emissions - 1.711 kg of CO2

**Authorised By:**

**Paul Boden BSc**  
Senior Project Manager

Please include all sections of this report if it is reproduced

Report : Liquid

**Liquids/products:** V=40ml vial, G=glass bottle, P=plastic bottle  
H=H<sub>2</sub>SO<sub>4</sub>, Z=ZnAc, N=NaOH, HN=HN<sub>3</sub>

[illegible]

## Element Materials Technology

### Notification of Deviating Samples

|                     |                |
|---------------------|----------------|
| <b>Client Name:</b> | Ramboll        |
| <b>Reference:</b>   | 1620016166-002 |
| <b>Location:</b>    | Manor Farm     |
| <b>Contact:</b>     | Eleanor Brown  |

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/6046

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

**Attention :** Eleanor Brown  
**Date :** 26th April, 2024  
**Your reference :** 1620016166-002  
**Our reference :** Test Report 24/6146 Batch 1 Schedule A  
**Location :** Manor Farm  
**Date samples received :** 11th April, 2024  
**Status :** Final Report  
**Issue :** 202404261118

Three samples were received for analysis on 11th April, 2024 of which three were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 11.801 kg of CO2

Scope 1&2&3 emissions - 27.889 kg of CO2

**Authorised By:**

**Simon Gomery BSc**  
Senior Project Manager

Please include all sections of this report if it is reproduced

### Notification of Deviating Samples

|                     |                |
|---------------------|----------------|
| <b>Client Name:</b> | Ramboll        |
| <b>Reference:</b>   | 1620016166-002 |
| <b>Location:</b>    | Manor Farm     |
| <b>Contact:</b>     | Eleanor Brown  |

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/6146

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |
| BS      | AQC Sample                                                                                                                                                               |
| LB      | Blank Sample                                                                                                                                                             |
| N       | Client Sample                                                                                                                                                            |
| TB      | Trip Blank Sample                                                                                                                                                        |
| OC      | Outside Calibration Range                                                                                                                                                |
|         |                                                                                                                                                                          |
| AA      | x2 Dilution                                                                                                                                                              |
| AB      | x3 Dilution                                                                                                                                                              |
| AC      | x5 Dilution                                                                                                                                                              |
| AD      | x10 Dilution                                                                                                                                                             |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

EMT Job No: 24/6146

| Test Method No. | Description                                                                                                                                                                                                                                                                                                                         | Prep Method No. (if appropriate) | Description                                                                                                                                                        | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |

| TM36            | Modified US EPA method 8015B v2:1996. Determination of Gasoline Range Organics (GRO) in the carbon chain range of C4-12 by headspace GC-FID. MTBE by GC/FID co-elutes with 3-methylpentane if present and therefore can give a false positive. Positive MTBE results will be re-run using GC-MS to double check, when requested. | PM12                             | Modified US EPA method 5021A v2:2014. Preparation of solid and liquid samples for GC headspace analysis. | Yes                   |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) – All anions comparable to BS ISO 15923-1: 2013I                           | PM0                              | No preparation is required.                                                                              |                       |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) – All anions comparable to BS ISO 15923-1: 2013I                           | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM42            | Modified US EPA method 8270D v5:2014. Pesticides and herbicides by GC-MS                                                                                                                                                                                                                                                         | PM30                             | Water samples are extracted with solvent using a magnetic stirrer to create a vortex.                    |                       |                        |                                                 |                              |
| TM57            | Modified US EPA Method 410.4. (Rev. 2.0 1993) Comparable with ISO 15705:2002. Chemical Oxygen Demand is determined by hot digestion with Potassium Dichromate and measured spectrophotometrically.                                                                                                                               | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM58            | APHA SMEWW 5210B:1999 22nd Edition. Comparable with ISO 5815:1989. Measurement of Biochemical Oxygen Demand. When cBOD (Carbonaceous BOD) is requested a nitrification inhibitor is added which prevents the oxidation of reduced forms of nitrogen, such as am                                                                  | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1.                                                                                                     | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                                                                                                                        | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                                                                                                                        | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                                                                                                                           | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |

**Attention :** Eleanor Brown  
**Date :** 1st May, 2024  
**Your reference :** 1620016166-002  
**Our reference :** Test Report 24/6146 Batch 1 Schedule B  
**Location :** Manor Farm  
**Date samples received :** 11th April, 2024  
**Status :** Final Report  
**Issue :** 202405011430

Three samples were received for analysis on 11th April, 2024 of which two were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 0.29 kg of CO2

Scope 1&2&3 emissions - 0.684 kg of CO2

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/6146

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |
| BS      | AQC Sample                                                                                                                                                               |
| LB      | Blank Sample                                                                                                                                                             |
| N       | Client Sample                                                                                                                                                            |
| TB      | Trip Blank Sample                                                                                                                                                        |
| OC      | Outside Calibration Range                                                                                                                                                |
|         |                                                                                                                                                                          |
| AA      | x8 Dilution                                                                                                                                                              |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

We received 9 samples on Friday April 12, 2024 and 9 of these samples were scheduled for analysis which was completed on Monday April 29, 2024. Accredited laboratory tests are defined within the report, but opinions, interpretations and on-site data expressed herein are outside the scope of ISO 17025 accreditation.

Should this report require incorporation into client reports, it must be used in its entirety and not simply with the data sections alone.

Chemical testing (unless subcontracted) performed at ALS Laboratories (UK) Limited Hawarden.

All sample data is provided by the customer. The reported results relate to the sample supplied, and on the basis that this data is correct.

Incorrect sampling dates and/or sample information will affect the validity of results.

The customer is not permitted to reproduce this report except in full without the approval of the laboratory.

## Appendix

1. Results are expressed on a dry weight basis (dried at 35°C) for all soil analyses except for the following: NRA and CEN Leach tests, flash point LOI, pH, ammonium as NH<sub>4</sub> by the BRE method, VOC TICs and SVOC TICs.

2. If sufficient sample is received a sub sample will be retained free of charge for 15 days after analysis is completed (e-mailed) for all sample types unless the sample is destroyed on testing. The prepared soil sub sample that is analysed for asbestos will be retained for a period of 6 months after the analysis date. All bulk samples will be retained for a period of 6 months after the analysis date. All samples received and not scheduled will be disposed of 15 days after the date of receipt unless we are instructed to the contrary. Once the initial period has expired, a storage charge will be applied for each month or part thereof until the client cancels the request for sample storage. ALS reserve the right to charge for samples received and stored but not analysed.

3. With respect to turnaround, we will always endeavour to meet client requirements wherever possible, but turnaround times cannot be absolutely guaranteed due to so many variables beyond our control.

4. We take responsibility for any test performed by sub-contractors (marked with an asterisk). We endeavour to use UKAS/MCERTS Accredited Laboratories, who either complete a quality questionnaire or are audited by ourselves. For some determinands there are no UKAS/MCERTS Accredited Laboratories, in this instance a laboratory with a known track record will be utilised.

5. If no separate volatile sample is supplied by the client, or if a headspace or sediment is present in the volatile sample, the integrity of the data may be compromised. This will be flagged up as an invalid VOC on the test schedule and the result marked as deviating on the test certificate.

6. NDP - No determination possible due to insufficient/unsuitable sample.

7. Results relate only to the items tested.

8. LoDs (Limit of Detection) for wet tests reported on a dry weight basis are not corrected for moisture content.

9. **Surrogate recoveries** - Surrogates are added to your sample to monitor recovery of the test requested. A % recovery is reported, results are not corrected for the recovery measured. Typical recoveries for organics tests are 70-130%. Recoveries in soils are affected by organic rich or clay rich matrices. Waters can be affected by remediation fluids or high amounts of sediment. Test results are only ever reported if all of the associated quality checks pass; it is assumed that all recoveries outside of the values above are due to matrix affect.

10. Stones/debris are not routinely removed. We always endeavour to take a representative sub sample from the received sample.

11. In certain circumstances the method detection limit may be elevated due to the sample being outside the calibration range. Other factors that may contribute to this include possible interferences. In both cases the sample would be diluted which would cause the method detection limit to be raised.

12. For dried and crushed preparations of soils volatile loss may occur e.g volatile mercury

13. For leachate preparations other than Zero Headspace Extraction (ZHE) volatile loss may occur.

14. For the BSEN 12457-3 two batch process to allow the cumulative release to be calculated, the volume of the leachate produced is measured and filtered for all tests. We therefore cannot carry out any unfiltered analysis. The tests affected include volatiles GCFID/GCMS and all subcontracted analysis.

15. Analysis and identification of specific compounds using GCFID is by retention time only, and we routinely calibrate and quantify for benzene, toluene, ethylbenzenes and xylenes (BTEx). For total volatiles in the C5-C12 range, the total area of the chromatogram is integrated and expressed as ug/kg or ug/l. Although this analysis is commonly used for the quantification of gasoline range organics (GRO), the system will also detect other compounds such as chlorinated solvents, and this may lead to a falsely high result with respect to hydrocarbons only. It is not possible to specifically identify these non-hydrocarbons, as standards are not routinely run for any other compounds, and for more definitive identification, volatiles by GCMS should be utilised.

16. We are accredited to MCERTS for sand, clay and loam/topsoil, or any of these materials - whether these are derived from naturally occurring soil profiles, or from fill/made ground, as long as these materials constitute the major part of the sample. Other coarse granular material such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

17 Data retention. All records, communications and reports pertaining to the analysis are archived for seven years from the date of issue of the final report.

## General

18. **Tentatively Identified Compounds (TICs)** are non-target peaks in VOC and SVOC analysis. All non-target peaks detected with a concentration above the LoD are subjected to a mass spectral library search. Non-target peaks with a library search confidence of >75% are reported based on the best mass spectral library match. When a non-target peak with a library search confidence of <75% is detected it is reported as "mixed hydrocarbons". Non-target compounds identified from the scan data are semi-quantified relative to one of the deuterated internal standards, under the same chromatographic conditions as the target compounds. This result is reported as a semi-quantitative value and reported as Tentatively Identified Compounds (TICs). TICs are outside the scope of UKAS accreditation and are not moisture corrected.

### 19. Sample Deviations

If a sample is classed as deviated then the associated results may be compromised.

|   |                                                                             |
|---|-----------------------------------------------------------------------------|
| 1 | Container with Headspace provided for volatiles analysis                    |
| 2 | Incorrect container received                                                |
| 3 | Deviation from method                                                       |
| 4 | Matrix interference                                                         |
| ♦ | Sample holding time exceeded in laboratory                                  |
| @ | Sample holding time exceeded due to late arrival of instructions or samples |
| § | Sampled on date not provided                                                |

### 20. Asbestos

When requested, the individual sub sample scheduled will be analysed in house for the presence of asbestos fibres and asbestos containing material by our documented in house method TM048 based on HSG 248 (2021), which is accredited to ISO17025. If a specific asbestos fibre type is not found this will be reported as "Not detected". If no asbestos fibre types are found all will be reported as "Not detected" and the sub sample analysed deemed to be clear of asbestos. If an asbestos fibre type is found it will be reported as detected (for each fibre type found). Testing can be carried out on asbestos positive samples, but, due to Health and Safety considerations, may be replaced by alternative tests or reported as No Determination Possible (NDP). The quantity of asbestos present is not determined unless specifically requested.

#### Identification of Asbestos in Bulk Materials & Soils

The results for identification of asbestos in bulk materials and soils are obtained from supplied bulk materials and soils which have been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining, based on HSG 248 (2021).

The results for identification of asbestos in soils are obtained from a homogenised sub sample which has been examined to determine the presence of asbestos fibres using ALS (Hawarden) in-house method of transmitted/polarised light microscopy and central stop dispersion staining.

| Asbestos Type         | Common Name    |
|-----------------------|----------------|
| Chrysotile            | White Asbestos |
| Amosite               | Brown Asbestos |
| Crocidolite           | Blue Asbestos  |
| Fibrous Actinolite    | -              |
| Fibrous Anthophyllite | -              |
| Fibrous Tremolite     | -              |

#### Visual Estimation Of Fibre Content

Estimation of fibre content is not permitted as part of our UKAS accredited test other than: - Trace - Where only one or two asbestos fibres were identified.

#### Respirable Fibres

Respirable fibres are defined as fibres of <3 µm diameter, longer than 5 µm and with aspect ratios of at least 3:1 that can be inhaled into the lower regions of the lung and are generally acknowledged to be most important predictor of hazard and risk for cancers of the lung.

**Further guidance on typical asbestos fibre content of manufactured products can be found in HSG 264.**

**The identification of asbestos containing materials and soils falls within our schedule of tests for which we hold UKAS accreditation, however opinions, interpretations and all other information contained in the report are outside the scope of UKAS accreditation.**

**Issue :** 202408071152

Four samples were received for analysis on 9th July, 2024 of which four were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – CO<sub>2</sub>e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 15.204 kg of CO<sub>2</sub>

Scope 1&2&3 emissions - 35.931 kg of CO<sub>2</sub>

## NDP Reason Report

**Matrix : Liquid**

[illegible]

## Element Materials Technology

### Notification of Deviating Samples

|                     |                |
|---------------------|----------------|
| <b>Client Name:</b> | Ramboll        |
| <b>Reference:</b>   | 1620016166-003 |
| <b>Location:</b>    | Manor Farm     |
| <b>Contact:</b>     | Eleanor Brown  |

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/11750

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |
| BS      | AQC Sample                                                                                                                                                               |
| LB      | Blank Sample                                                                                                                                                             |
| N       | Client Sample                                                                                                                                                            |
| TB      | Trip Blank Sample                                                                                                                                                        |
| OC      | Outside Calibration Range                                                                                                                                                |
|         |                                                                                                                                                                          |
| AA      | x3 Dilution                                                                                                                                                              |

| AC      | x8 Dilution                                                                                                                                                              |
| AD      | x10 Dilution                                                                                                                                                             |
| AE      | x100 Dilution                                                                                                                                                            |
| AF      | x250 Dilution                                                                                                                                                            |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

## Method Code Appendix

EMT Job No: 24/11750

| Test Method No. | Description                                                                                                                                                                                                        | Prep Method No. (if appropriate) | Description                                                                                                                                                        | ISO 17025 (UKAS/S ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|------------------------|-------------------------------------------------|------------------------------|
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                             | PM0                              | No preparation is required.                                                                                                                                        | Yes                     |                        |                                                 |                              |
| TM170           | Determination of Trace Metals by ICP-MS (Inductively Coupled Plasma – Mass Spectrometry): Modified USEPA Method 200.8, Rev. 5.4, 1994; Modified EPA Method 6020A, Rev.1, Feb 2007; Modified BS EN ISO 17294-2:2016 | PM14                             | Preparation of waters and leachates for metals by ICP OES/ICP MS. Samples are filtered for Dissolved metals, and remain unfiltered for Total metals then acidified | Yes                     |                        |                                                 |                              |
| TM176           | Free ammonia based on the pH and temperature dependent equilibrium calculated in accordance with NRA Water Quality Objectives 1994 using the ammoniacal nitrogen result.                                           | PM0                              | No preparation is required.                                                                                                                                        |                         |                        |                                                 |                              |
| NONE            | No Method Code                                                                                                                                                                                                     | NONE                             | No Method Code                                                                                                                                                     |                         |                        |                                                 |                              |
| Subcontracted   | See attached subcontractor report for accreditation status and provider.                                                                                                                                           |                                  |                                                                                                                                                                    |                         |                        |                                                 |                              |

**Attention :** Eleanor Brown  
**Date :** 22nd July, 2024  
**Your reference :** 162001616-003  
**Our reference :** Test Report 24/11830 Batch 1  
**Location :** Manor Farm  
**Date samples received :** 10th July, 2024  
**Status :** Final Report  
**Issue :** 202407221539

Eight samples were received for analysis on 10th July, 2024 of which eight were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 25.05 kg of CO2

Scope 1&2&3 emissions - 59.201 kg of CO2

**Authorised By:**

**Paul Boden BSc**  
Senior Project Manager

## Element Materials Technology

Client Name: Ramboll  
Reference: 162001616-003  
Location: Manor Farm  
Contact: Eleanor Brown  
EMT Job No: 24/11830

Report : Liquid

Liquids/products: V=40ml vial, G=glass bottle, P=plastic bottle  
H=H<sub>2</sub>SO<sub>4</sub>, Z=ZnAc, N=NaOH, HN=HNO<sub>3</sub>

Please include all sections of this report if it is reproduced

## Element Materials Technology

### Notification of Deviating Samples

|                     |               |
|---------------------|---------------|
| <b>Client Name:</b> | Ramboll       |
| <b>Reference:</b>   | 162001616-003 |
| <b>Location:</b>    | Manor Farm    |
| <b>Contact:</b>     | Eleanor Brown |

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/11830

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

EMT Job No: 24/11830

| Test Method No. | Description                                                                                                                                                                                                                                                                                                                         | Prep Method No. (if appropriate) | Description                                                                                                                                                        | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |

| TM36            | Modified US EPA method 8015B v2:1996. Determination of Gasoline Range Organics (GRO) in the carbon chain range of C4-12 by headspace GC-FID. MTBE by GCFID co-elutes with 3-methylpentane if present and therefore can give a false positive. Positive MTBE results will be re-run using GC-MS to double check, when requested. | PM12                             | Modified US EPA method 5021A v2:2014. Preparation of solid and liquid samples for GC headspace analysis. | Yes                   |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) – All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                              |                       |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) – All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM57            | Modified US EPA Method 410.4. (Rev. 2.0 1993) Comparable with ISO 15705:2002. Chemical Oxygen Demand is determined by hot digestion with Potassium Dichromate and measured spectrophotometrically.                                                                                                                              | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM58            | APHA SMEWW 5210B:1999 22nd Edition. Comparable with ISO 5815:1989. Measurement of Biochemical Oxygen Demand. When cBOD (Carbonaceous BOD) is requested a nitrification inhibitor is added which prevents the oxidation of reduced forms of nitrogen, such as am                                                                 | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1.                                                                                                    | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                                                                                                                          | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                                                                                                                        | PM122                            | SPE Preparation of Water Samples for PFAS analysis by LC-MS/MS                                           |                       |                        |                                                 |                              |

**Attention :** Eleanor Brown  
**Date :** 25th July, 2024  
**Your reference :** 162001616-003  
**Our reference :** Test Report 24/11922 Batch 1  
**Location :** Manor Farm  
**Date samples received :** 11th July, 2024  
**Status :** Final Report  
**Issue :** 202407251230

Four samples were received for analysis on 11th July, 2024 of which four were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 15.494 kg of CO2

Scope 1&2&3 emissions - 36.615 kg of CO2

**Authorised By:**

**Paul Boden BSc**  
Senior Project Manager

## Element Materials Technology

Client Name: Ramboll  
Reference: 162001616-003  
Location: Manor Farm  
Contact: Eleanor Brown  
EMT Job No: 24/11922

Report : Liquid

Liquids/products: V=40ml vial, G=glass bottle, P=plastic bottle  
H=H<sub>2</sub>SO<sub>4</sub>, Z=ZnAc, N=NaOH, HN=HN0<sub>3</sub>

## Element Materials Technology

### Notification of Deviating Samples

|                     |               |
|---------------------|---------------|
| <b>Client Name:</b> | Ramboll       |
| <b>Reference:</b>   | 162001616-003 |
| <b>Location:</b>    | Manor Farm    |
| <b>Contact:</b>     | Eleanor Brown |

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/11922

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

EMT Job No: 24/11922

| Test Method No. | Description                                                                                                                                                                                                                                                                                                                         | Prep Method No. (if appropriate) | Description                                                                                                                                                        | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |

| TM36            | Modified US EPA method 8015B v2:1996. Determination of Gasoline Range Organics (GRO) in the carbon chain range of C4-12 by headspace GC-FID. MTBE by GCFID co-elutes with 3-methylpentane if present and therefore can give a false positive. Positive MTBE results will be re-run using GC-MS to double check, when requested. | PM12                             | Modified US EPA method 5021A v2:2014. Preparation of solid and liquid samples for GC headspace analysis. | Yes                   |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) – All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                              |                       |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) – All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM57            | Modified US EPA Method 410.4. (Rev. 2.0 1993) Comparable with ISO 15705:2002. Chemical Oxygen Demand is determined by hot digestion with Potassium Dichromate and measured spectrophotometrically.                                                                                                                              | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM58            | APHA SMEWW 5210B:1999 22nd Edition. Comparable with ISO 5815:1989. Measurement of Biochemical Oxygen Demand. When cBOD (Carbonaceous BOD) is requested a nitrification inhibitor is added which prevents the oxidation of reduced forms of nitrogen, such as am                                                                 | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1.                                                                                                    | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                                                                                                                          | PM0                              | No preparation is required.                                                                              | Yes                   |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                                                                                                                        | PM122                            | SPE Preparation of Water Samples for PFAS analysis by LC-MS/MS                                           |                       |                        |                                                 |                              |

**Attention :** Eleanor Brown  
**Date :** 30th October, 2024  
**Your reference :** 1620016166-003  
**Our reference :** Test Report 24/17232 Batch 1  
**Location :** Manor Farm  
**Date samples received :** 10th October, 2024  
**Status :** Final Report  
**Issue :** 202410301217

Eleven samples were received for analysis on 10th October, 2024 of which eleven were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 45.902 kg of CO2

Scope 1&2&3 emissions - 108.477 kg of CO2

**Authorised By:**

## Element Materials Technology

### Notification of Deviating Samples

|                     |                |
|---------------------|----------------|
| <b>Client Name:</b> | Ramboll        |
| <b>Reference:</b>   | 1620016166-003 |
| <b>Location:</b>    | Manor Farm     |
| <b>Contact:</b>     | Eleanor Brown  |

[illegible]

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating. Only analyses which are accredited are recorded as deviating if set criteria are not met.

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/17232

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

EMT Job No: 24/17232

| Test Method No. | Description                                                                                                                                                                                                                                                                                                                       | Prep Method No. (if appropriate) | Description                                                                                                                                                        | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |

| TM36            | Modified US EPA method 8015B v2:1996. Determination of Gasoline Range Organics (GRO) in the carbon chain range of C4-12 by headspace GC-FID. MTBE by GCFID co-elutes with 3-methylpentane if present and therefore can give a false positive. Positive MTBE results will be re-run using GC-MS to double check, when requested. | PM12                             | Modified US EPA method 5021A v2:2014. Preparation of solid and liquid samples for GC headspace analysis.                | Yes                   |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) - All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                                             |                       |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) - All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM57            | Modified US EPA Method 410.4. (Rev. 2.0 1993) Comparable with ISO 15705:2002. Chemical Oxygen Demand is determined by hot digestion with Potassium Dichromate and measured spectrophotometrically.                                                                                                                              | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM58            | APHA SMEWW 5210B:1999 22nd Edition. Comparable with ISO 5815:1989. Measurement of Biochemical Oxygen Demand. When cBOD (Carbonaceous BOD) is requested a nitrification inhibitor is added which prevents the oxidation of reduced forms of nitrogen, such as am                                                                 | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1.                                                                                                    | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                                                                                                                          | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                                                                                                                        | PM121                            | Preparation of PFAS liquid samples – As received samples are centrifuged and the supernatant is used for PFAS analysis. |                       |                        |                                                 |                              |

**Attention :** Eleanor Brown  
**Date :** 30th October, 2024  
**Your reference :** 1620016166-003  
**Our reference :** Test Report 24/17232 Batch 2  
**Location :** Manor Farm  
**Date samples received :** 11th October, 2024  
**Status :** Final Report  
**Issue :** 202410301215

Two samples were received for analysis on 11th October, 2024 of which two were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.

All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

The greenhouse gas emissions generated (in Carbon – Co2e) to obtain the results in this report are estimated as:

Scope 1&2 emissions - 7.819 kg of CO2

Scope 1&2&3 emissions - 18.479 kg of CO2

Please see attached notes for all abbreviations and acronyms

Please include all sections of this report if it is reproduced

**VOC Report :**        **Liquid**

Please see attached notes for all abbreviations and acronyms

[illegible]

It is a requirement under ISO 17025 that we inform clients if samples are deviating i.e. outside what is expected. A deviating sample indicates that the sample 'may' be compromised but not necessarily will be compromised. The result is still accredited and our analytical reports will still show accreditation on the relevant analytes.

EMT Job No.: 24/17232

**SOILS and ASH**

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 35°C ±5°C.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overestimate when other sulphides such as Barite (Barium Sulphate) are present.

**WATERS**

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil is quoted, this refers to Total Aliphatics C10-C40.

**STACK EMISSIONS**

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

**DEVIATING SAMPLES**

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

**SURROGATES**

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

**DILUTIONS**

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

**BLANKS**

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

**NOTE**

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.

Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.

Laboratory records are kept for a period of no less than 6 years.

**REPORTS FROM THE SOUTH AFRICA LABORATORY**

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

**Measurement Uncertainty**

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

**Customer Provided Information**

Sample ID and depth is information provided by the customer.

**Age of Diesel**

The age of release estimation is based on the nC17/pristane ratio only as prescribed by Christensen and Larsen (1993) and Kaplan, Galperin, Alimi et al., (1996).

Age estimation should be treated with caution as it can be influenced by site specific factors of which the laboratory are not aware.

**Tentatively Identified Compounds (TICs)**

Where Tentatively Identified Compounds (TICs) are reported, up to 10 Tentatively Identified Compounds will be listed where there is found to be a greater than 80% match with the NIST library. The reported concentration is determined semi-quantitatively, with a matrix specific limit of detection.

Note, other compounds may be present but are not reported.

## ABBREVIATIONS and ACRONYMS USED

|         |                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #       | ISO17025 (UKAS Ref No. 4225) accredited - UK.                                                                                                                            |
| SA      | ISO17025 (SANAS Ref No.T0729) accredited - South Africa                                                                                                                  |
| B       | Indicates analyte found in associated method blank.                                                                                                                      |
| DR      | Dilution required.                                                                                                                                                       |
| M       | MCERTS accredited.                                                                                                                                                       |
| NA      | Not applicable                                                                                                                                                           |
| NAD     | No Asbestos Detected.                                                                                                                                                    |
| ND      | None Detected (usually refers to VOC and/SVOC TICs).                                                                                                                     |
| NDP     | No Determination Possible                                                                                                                                                |
| SS      | Calibrated against a single substance                                                                                                                                    |
| SV      | Surrogate recovery outside performance criteria. This may be due to a matrix effect.                                                                                     |
| W       | Results expressed on as received basis.                                                                                                                                  |
| +       | AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.                                                               |
| >>      | Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher. |
| *       | Analysis subcontracted to an Element Materials Technology approved laboratory.                                                                                           |
| CO      | Suspected carry over                                                                                                                                                     |
| LOD/LOR | Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS                                                                                                |
| ME      | Matrix Effect                                                                                                                                                            |
| NFD     | No Fibres Detected                                                                                                                                                       |

# HWOL ACRONYMS AND OPERATORS USED

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| HS    | Headspace Analysis.                                                  |
| EH    | Extractable Hydrocarbons - i.e. everything extracted by the solvent. |
| CU    | Clean-up - e.g. by florisil, silica gel.                             |
| 1D    | GC - Single coil gas chromatography.                                 |
| Total | Aliphatics & Aromatics.                                              |
| AL    | Aliphatics only.                                                     |
| AR    | Aromatics only.                                                      |
| 2D    | GC-GC - Double coil gas chromatography.                              |
| #1    | EH_Total but with humics mathematically subtracted                   |
| #2    | EU_Total but with fatty acids mathematically subtracted              |
| _     | Operator - underscore to separate acronyms (exception for +).        |
| +     | Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total   |
| MS    | Mass Spectrometry.                                                   |

## Element Materials Technology

## Method Code Appendix

EMT Job No: 24/17232

| Test Method No. | Description                                                                                                                                                                                                                                                                                                                       | Prep Method No. (if appropriate) | Description                                                                                                                                                        | ISO 17025 (UKAS/ANAS) | MCERTS (UK soils only) | Analysis done on As Received (AR) or Dried (AD) | Reported on dry weight basis |

| TM36            | Modified US EPA method 8015B v2:1996. Determination of Gasoline Range Organics (GRO) in the carbon chain range of C4-12 by headspace GC-FID. MTBE by GCFID co-elutes with 3-methylpentane if present and therefore can give a false positive. Positive MTBE results will be re-run using GC-MS to double check, when requested. | PM12                             | Modified US EPA method 5021A v2:2014. Preparation of solid and liquid samples for GC headspace analysis.                | Yes                   |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) - All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                                             |                       |                        |                                                 |                              |
| TM38            | Soluble Ion analysis using Discrete Analyser. Modified US EPA methods: Chloride 325.2 (1978), Sulphate 375.4 (Rev.2 1993), o-Phosphate 365.2 (Rev.2 1993), TON 353.1 (Rev.2 1993), Nitrite 354.1 (1971), Hex Cr 7196A (1992), NH4+ 350.1 (Rev.2 1993) - All anions comparable to BS ISO 15923-1: 2013I                          | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM57            | Modified US EPA Method 410.4. (Rev. 2.0 1993) Comparable with ISO 15705:2002. Chemical Oxygen Demand is determined by hot digestion with Potassium Dichromate and measured spectrophotometrically.                                                                                                                              | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM58            | APHA SMEWW 5210B:1999 22nd Edition. Comparable with ISO 5815:1989. Measurement of Biochemical Oxygen Demand. When cBOD (Carbonaceous BOD) is requested a nitrification inhibitor is added which prevents the oxidation of reduced forms of nitrogen, such as am                                                                 | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM60            | TC/TOC analysis of Waters by High Temperature Combustion followed by NDIR detection. Based on the following modified standard methods: USEPA 9060A (2002), APHA SMEWW 5310B:1999 22nd Edition, ASTM D 7573, and USEPA 415.1.                                                                                                    | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM73            | Modified US EPA methods 150.1 (1982) and 9045D Rev. 4 - 2004) and BS1377-3:1990. Determination of pH by Metrohm automated probe analyser.                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM75            | Modified US EPA method 310.1 (1978). Determination of Alkalinity by Metrohm automated titration analyser.                                                                                                                                                                                                                       | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM89            | Modified USEPA method OIA-1667 (1999). Determination of cyanide by Flow Injection Analyser. Where WAD cyanides are required a Ligand displacement step is carried out before analysis.                                                                                                                                          | PM0                              | No preparation is required.                                                                                             | Yes                   |                        |                                                 |                              |
| TM135           | Analysis of PFAS compounds in Water and Soil by LC-MS/MS                                                                                                                                                                                                                                                                        | PM121                            | Preparation of PFAS liquid samples – As received samples are centrifuged and the supernatant is used for PFAS analysis. |                       |                        |                                                 |                              |

## Executive Summary

Ramboll UK Limited (Ramboll) has been instructed by Manor Farm Propco Limited (the “Client”) to prepare an Annual Monitoring Report for an area of land at Manor Farm, Poyle, Slough, SL3 0BL (the “Site”) to assist in the proposed demolition of existing buildings and site re-levelling, erection of a building for use as a data centre, erection of a sub-station, a Battery Energy Storage System (BESS), as well as associated external works and utility infrastructure, site access works, internal circulation routes and landscaping. A Site Location Plan is provided in Figure 1.

Quarterly rounds of ground gas and groundwater monitoring and sampling were undertaken across a select number of boreholes throughout 2024. Sampling of waters across the site was from the perched groundwater within the landfill waste and Made Ground material. In order to characterise the ground gas regime four monitoring rounds were carried out; concentrations of ground gases and ground gas flow rates were monitored using a gas meter (GFM) and concentrations of volatile organic compounds (VOCs) were monitored using a photo-ionisation detector (PID). The depth to resting groundwater levels were recorded during the groundwater monitoring rounds.

Evidence of residual groundwater contamination encountered was consistent with historic use of the south and the north-west of the site as a landfill and the north-east of the site for light industrial/ commercial uses, which also resulted in infilling (as reworked construction and natural materials).

The presence of residual concentrations of contaminants including ammoniacal nitrogen, iron and petroleum hydrocarbons in groundwater is considered to be typical of a site subject to variable filling. Whilst there is contamination present the potential for this to represent a significant risk to wider groundwater or surface waters is considered to be limited. Petroleum hydrocarbon contamination identified locally close to the USTs in the north of the site is also considered to be associated with the presence of the now decommissioned diesel USTs; however, it is understood that below ground fuel infrastructure will be removed as part of the development.

Whilst exceedances of inorganic and organic contaminants were recorded in excess of relevant GAC or EQS protective of groundwater and surface water environments, the presence of low permeability clayey Made Ground/reworked alluvium deposits along the boundary is expected to act as a mitigating factor to off-site migration. Likewise, deposits of low permeability Alluvium in the east of the site are expected to limit lateral migration, which could potentially impact the off-site superficial aquifer. The deeper chalk aquifer is considered to be protected from vertical migration of impacted groundwater due to the presence of the underlying impermeable bedrock.

No observable seasonal trend in the concentrations of contaminants was recorded in samples of groundwater, although exceedances of quality standards were typically recorded in the same locations during all monitoring rounds. However, no significant source-pathway-receptor relationships have been identified.

No exceedances of screening of groundwater samples against the GAC for a commercial/ industrial development were encountered, indicating that a significant groundwater volatilisation source is not present beneath the site.

The difference in elevation between groundwater beneath the site and surface water levels within the adjacent Poyle Channel indicates that the two waterbodies are not in significant hydraulic continuity. In addition, no correspondingly increased concentrations of contaminants have been recorded in surface water samples taken from the Poyle Channel or Colne Brook. This indicates

that contaminated groundwater beneath the site is likely not interacting with nearby surface waters to a significant extent, and therefore a significant potential risk has been identified.

Ramboll's ground gas monitoring data recorded concentrations and flow rates consistent with a Characteristic Situation 2 classification; however, given elevated concentrations of methane and carbon dioxide it is recommended that the site be classified as CS3 (moderate risk) which is typical of old landfill sites.

Identified contamination is considered to be manageable in the context of the proposed low sensitivity commercial use. Furthermore, the proposed development will improve the existing site conditions and remove obvious sources of contamination (e.g. underground storage tanks) during the works. The site is considered suitable for commercial development, however, further investigation to delineate areas of potential contamination and provide ground and groundwater information in areas of data gaps is recommended.

# 1. Introduction

## 1.1 Background

Ramboll UK Ltd (Ramboll) was commissioned by Manor Farm Propco Limited (the Client) to undertake quarterly groundwater and ground gas monitoring at Manor Farm, Poyle, Slough ("the site") in association with the proposed redevelopment of the site as a datacentre and a battery energy storage system (BESS). A Site Location plan is provided in Figure 1.

The site comprises two main areas, which are connected by a strip of land that runs from north to south. The northern section consists of two large areas used for airport car parking with the central and western areas comprising a mix of light industrial and commercial units. A residential building is situated in the east of the site adjacent to the access road leading from Poyle Road. Part of this area was formerly a builder's yard, in which there are two underground diesel storage tanks (USTs). This area is intended to be developed as a datacentre. The central area of the site comprises a narrow strip of land running from north to south. Thames Wire Metalworks, a metal fabricator warehouse with smaller ancillary buildings and areas of car parking and materials storage is located in the north of this strip. This area is intended to be developed as a datacentre strip. This corridor provides access between the two main development areas.

The southern parcel comprises approximately 25% of the site and consists of vacant former agricultural land and some derelict metal sheds with a footpath running from west to east along its northern extent. This area is intended to be developed as a Battery Energy Storage System (BESS). The south and a marginal area in the north-west of the site has historically been subject to widespread gravel extraction and then used as a landfill (1948-1980, licensed from 1974). The majority of the northern portion of the site appears to comprise more re-worked natural deposits and construction wastes and this aligns to the regulatory records of the extent of the landfill. Infilled ground in the south of the site typically contained a mixture of construction wastes as well as plastic, timber and bagged plastic waste. There is no record or evidence of the landfill being provided with engineered controls such as a landfill cap, walls or basal layer and so effectively acts as a 'dilute and disperse' landfill. The landfill extended off to the west and a separate landfill was present to the immediate north of a similar age. A plan showing the location of the boreholes on site is provided in Appendix 1.

## 1.2 Scope of Work

The scope of works was undertaken in line with Ramboll's proposal dated 5<sup>th</sup> February 2024, reference REH2023N00008--RAM-PO-00001.docx. Completed works comprised groundwater sampling across a range of boreholes (nine boreholes within and around the development area and five across the wider landfill site to the west) and three surface water samples; two from up and downstream of the Colne Brook and one upstream from the Poyle Channel. Notable exceptions to the proposed scope of works are:

- Due to consistent ground and surface water flooding of BH2525 this could not be sampled and BH2526 was sampled as an alternative location throughout the monitoring.
- Gas monitoring was undertaken at a later date than the groundwater monitoring during the February monitoring round (15<sup>th</sup> March), due to water damage to the gas meter.
- It was not possible to sample WS16 or WS18 during the July monitoring round due to extensive vegetation growth in the area preventing access.
- Pesticides and herbicides were not detected above the LMDL during the February monitoring round and were generally below the LMDL during subsequent visits. As a result, these were excluded from testing during the later July and October monitoring rounds.

## 2. Summary of Monitoring Works

### 2.1 Groundwater and Ground Gas Monitoring

Quarterly rounds of ground gas and groundwater monitoring were undertaken across a select number of boreholes throughout 2024. These comprised sampling of four on-site boreholes (BH2514, BH2516, BH2518 and BH2520) and three within the immediate vicinity of the development area (BH2513, BH2517 and BH2522) quarterly with an additional seven locations on and off-site (WS06, WS07, WS13, WS16 and WS18 from the wider landfill site to the west, and BH2526 and BH2527 in the south of the site) monitored every six months. Sampling of waters across the site was from the perched groundwater within the landfill waste and Made Ground material; a list of the pairs of HAL boreholes monitored is presented in [Table 2-1](#) below.

In order to characterise the ground gas regime four monitoring rounds were carried out throughout 2024, see the list below:

- Round 1 – 26<sup>th</sup> – 28<sup>th</sup> February (additional gas monitoring undertaken 15<sup>th</sup> March);
- Round 2 – 9<sup>th</sup> – 10<sup>th</sup> April;
- Round 3 – 8<sup>th</sup> – 10<sup>th</sup> July; and,
- Round 4 – 8<sup>th</sup> – 10<sup>th</sup> October.

Concentrations of ground gases and flow rates were monitored using a gas meter (GFM) and concentrations of volatile organic compounds (VOCs) were monitored using a photo-ionisation detector (PID). Depth to resting groundwater levels were recorded using a dip meter; a summary of the groundwater levels and evidence for contamination observed throughout the monitoring period is provided in [Table 2-2](#).

**Table 2-1 – HAL Borehole Installations Monitored**

| HAL Borehole Location                          | Deep Installation (Groundwater) | Shallow Installation (Ground Gas) |
|------------------------------------------------|---------------------------------|-----------------------------------|
| <b>On-Site (Datacentre Development Area)</b>   |                                 |                                   |
| BH2514                                         | X                               |                                   |
| BH2498                                         |                                 | X                                 |
| BH2518                                         | X                               |                                   |
| BH2499                                         |                                 | X                                 |
| BH2520                                         | X                               |                                   |
| BH2506                                         |                                 | X                                 |
| <b>On-Site (Battery Energy Storage System)</b> |                                 |                                   |
| BH2526                                         | X                               |                                   |
| BH2488                                         |                                 | X                                 |
| BH2527                                         | X                               |                                   |
| BH2484                                         |                                 | X                                 |
| <b>Off-Site (within 50m)</b>                   |                                 |                                   |
| BH2513                                         | X                               |                                   |
| BH2496                                         |                                 | X                                 |
| BH2517                                         | X                               |                                   |
| BH2495                                         |                                 | X                                 |
| BH2522                                         | X                               |                                   |
| BH2497                                         |                                 | X                                 |
| BH2524                                         | X                               |                                   |
| BH2486                                         |                                 | X                                 |

The first monitoring round (Round 1) in February 2024 utilised bailers to purge and sample each borehole. From April 2024 onwards low flow techniques were used to sample each borehole,

which can allow for purging of water whilst reducing the turbidity of the sample and allowing for on-site indicators as to water quality.

Three surface water samples were collected during each monitoring visit, comprising two samples from up and downstream in the Colne Brook of the site, and one sample taken from upstream of the site in the Poyle Channel.

One duplicate groundwater sample was taken during each monitoring round for QA purposes. Samples were placed in containers appropriate for the type of analysis, sealed and labelled, and stored in cool boxes under chilled conditions prior to transportation to an accredited independent analytical laboratory (Element Materials Technology Ltd) with relevant chain of custody documentation. Laboratory certificates are provided in Appendix 2.

Table 2-2 – Groundwater Observations

| Monitoring Well  | Groundwater Encountered? | Range in Depth to Groundwater (m bgl) | Range in Groundwater Elevation (m AOD) | Inferred Aquifer Containing Groundwater <sup>1</sup> | Evidence for Contamination                                                                                                                                | Range of PID readings (ppm) |

## 2.2 Groundwater Levels

Groundwater levels across the majority of the site appear to be relatively level, with a moderate increase in elevation towards the north of the site. This increase may be a result of leaching from the Poyle Channel. The range in recorded groundwater elevations was between 17.88 mAOD in BH2488 during Round 1 and 20.42 mAOD in BH2518 in Round 3.

Groundwater contour plans show that groundwater in the northern half of the site typically flows towards the east, with some northerly flow present in the north-west of the site. Flow direction in the south is generally inferred to the west; flow within the wider off-site landfill is notably variable, likely as a result of the heterogeneous nature of the underlying waste materials. The contour plots were produced based on monitoring data provided from spring (Round 2, April 2024) and autumn (Round 4, October 2024) to capture seasonal variation in groundwater levels; no significant variation in flow direction was noted across the different contour plots.

### 3. Groundwater Risk Assessment

#### 3.1 Controlled Waters Environment

The superficial deposits beneath the site are classified as a Principal Aquifer (Shepperton Gravel Member) and a Secondary A Aquifer (Alluvium). As such, these are considered to be moderately sensitive receptors although it should be noted that the site is not in a groundwater Source Protection Zone (SPZ). Groundwater in the region is also considered to be of a generally poor quality, associated with the surrounding landfill, nearby longstanding trading estate and the presence of Heathrow Airport; groundwater (Lower Thames Gravels) has a 'Poor' Quantitative Status under the Water Framework Directive classification scheme.

The majority of the site was previously underlain by the Shepperton Gravel Member; however, this has been subject to gravel extraction and infilling, which will have affected the properties of the aquifer and significantly reduced its resource potential and sensitivity. The north-east of the site is mapped to be underlain by superficial deposits of Alluvium, which is present in the form of relatively impermeable deposits of silt. This has not been proven in on-site boreholes to date, but off-site boreholes have identified clay deposits close to the river/channel. Superficial deposits are underlain by bedrock of the London Clay Formation, which overlies the London Lower Tertiaries (Superficial) and chalk Principal Aquifer positioned at depth.

The nearest identified watercourse is the Poyle Channel located approximately 10m north of the site at its closest point, which flows into the Colne Brook approximately 300m to the north-west of the site. Wraysbury Reservoir is also located 135m to the south of the site. Surface water within the Colne Brook waterbody and Wraysbury Reservoir Water Body were classified as being of 'Moderate'. Given the engineered nature of the reservoir the waterbody is likely to be lined with impermeable materials, preventing interaction with groundwater beneath the site.

Groundwater contour plans show that groundwater in the northern half of the site typically flows towards the east, with some northerly flow present in the north-west of the site. Flow direction in the south is generally inferred to the west; flow within the wider off-site landfill is notably variable, likely as a result of the heterogenous nature of the underlying waste materials.

Based on publicly available surface water level data obtained from an upstream gauge approximately 300m to the east of the site, water level within the channel is located at an average depth of 20.6 mAOD. Groundwater levels beneath the site at the closest location to the channel (BH2516) during the same period (October 2024) were recorded at a depth of 19.11 mAOD. As this groundwater level is positioned towards the base of the water level of the Poyle Channel this indicates that the two water bodies are not in significant hydraulic continuity, limiting any potential interaction between the two waterbodies. This is further evidenced by the flow direction within the perched groundwater in the Made Ground being predominantly to the east with only limited flow recorded to the north in the north-east of the site towards the Poyle Channel. Local soakaways may also be influencing groundwater flow on-site.

#### 3.2 Assessment Approach

The detected concentrations have been screened versus groundwater standards (GS) and Environmental Quality Standards (EQS) for risks to surface waters. Some groundwater standards are based on the protection of drinking water, which is overly conservative for this site which is not located in a drinking water zone – in the absence of other authoritative standards. Therefore, exceedances of these conservative standards are noted but where the exceedances are not significantly elevated these are dismissed as insignificant, as noted in the risk assessment

findings. Groundwater sample screening tables are presented in full in Appendix 3, with key results presented below.

The following determinands were not detected above or generally below the Laboratory Method Detection Limit (LMDL) and will not be discussed further in this report:

- Metals (cadmium, nickel, selenium, vanadium and zinc);
- Phenols;
- BTEX (with the exception of benzene) or MTBE;
- Cyanide;
- Volatile Organic Compounds (VOCs) with the exception of vinyl chloride and benzene; and,
- Semi-Volatile Organic Compounds (SVOCs).

[Table 3-1](#) below provides a summary of the risk assessment for groundwater resources and [Table 3-2](#) provides a summary of the risk assessment for the surface water environment. Exceedances of screening criteria do not infer that an unacceptable risk is present; the outcome of the screening is assessed further in the context of a qualitative source-pathway-receptor risk assessment.

### 3.3 Risks to Human Health Receptors

The groundwater analytical results obtained have been screened against commercial/industrial GAC; whilst a residential dwelling currently resides in the north-east of the site it is understood that no on-site residential receptors will be present following the redevelopment. As such, results screened against residential GAC are considered to be overly conservative and not representative of risk posed to potential human health receptors.

No exceedances of screening of groundwater samples against the commercial/industrial GAC were encountered, indicating that a viable groundwater volatilisation pathway is not present beneath the site. No exceedances of the GAC for a residential end use were recorded on or within the immediate vicinity of the site.

Table 3-1 Risks to the Groundwater Environment

| Contaminant                             | No. of Samples | GAC (µg/l)<br>[Source] | Number of Exceedances of GAC recorded | Minimum Concentration (µg/l) | Maximum Concentration (µg/l) | Distribution Comment                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|----------------|------------------------|---------------------------------------|------------------------------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Metals</b>                           |                |                        |                                       |                              |                              |                                                                                                                                                                                                                                                                                                                        |
| Arsenic                                 | 34             | 5 [G1]                 | 13                                    | <0.9                         | 51.9 (BH2526, July 2024)     | Elevated concentrations were consistently recorded on and directly off-site in the north (BH2513, BH2514, BH2517, BH2520 and BH2522). Samples taken from BH2525, BH2526 and BH2527 in the south of the site also consistently exceeded the GAC.                                                                        |
| Boron                                   | 34             | 750 [G2]               | 11                                    | <3.0                         | 2,207 (BH2517, Oct 2024)     | Positions consistently recording exceedances of boron were typically located in the west of the site or immediately off-site to the west (BH2513, BH2514, BH2515, BH2517, BH2519, BH2522 and BH2524).                                                                                                                  |
| Iron                                    | 34             | 200 [G3]               | 18                                    | <2.0                         | 29,807.3 (BH2526, Oct 2024)  | Exceedances located across the site, with higher concentrations recorded in the south.                                                                                                                                                                                                                                 |
| <b>Organics</b>                         |                |                        |                                       |                              |                              |                                                                                                                                                                                                                                                                                                                        |
| <b>Polycyclic Aromatic Hydrocarbons</b> |                |                        |                                       |                              |                              |                                                                                                                                                                                                                                                                                                                        |
| Anthracene                              | 34             | 0.05 [G1]              | 13                                    | <0.005                       | 0.978 (BH2520, Feb 2024)     | BH2520 recorded consistently elevated concentrations of Anthracene, which may relate to the infill in this area and is also downgradient of the USTs. Exceedances of GAC were present across the north of the site, although at relatively low concentrations; no exceedances were noted across the south of the site. |
| Benzo(a)pyrene                          | 34             | 0.005 [G1]             | 16                                    | <0.005                       | 4.888 (BH2520, Feb 2024)     | The highest concentration on-site was recorded in BH2520, which is located downgradient of the fuel USTs. Relatively low exceedances of the GAC were recorded in the majority of locations across the site.                                                                                                            |
| Benzo(b)fluoranthene                    | 34             | 0.05 [G1]              | 8                                     | <0.008                       | 7.093 (BH2520, Feb 2024)     | The number of exceedances were relatively low, with elevated concentrations recorded on and off-site in the north-west. No exceedances were recorded in the south of the site.                                                                                                                                         |
| Benzo(g,h,i)perylene                    | 34             | 0.05 [G1]              | 7                                     | <LoD                         | 4.301 (BH2520, Feb 2024)     | Similar to other PAHs, the highest concentrations were recorded in BH2520. Other locations with marginal exceedances included BH2513, BH2516 and BH2522, with none recorded in the south of the site.                                                                                                                  |
| Benzo(k)fluoranthene                    | 34             | 0.05 [G1]              | 6                                     | <LoD                         | 2.759 (BH2520, Feb 2024)     | Exceedances were consistently recorded at BH2520 throughout all monitoring rounds, with other elevated concentrations detected in BH2513 and BH2522 during the February 2024 monitoring round. No exceedances were recorded in the south of the site.                                                                  |

| Total PFAS                                       | 23             | 0.5 [G5]            | 5                                     | <LoD                         | 4.3416 (BH2517, July 2024)   | Only two locations on-site recorded exceedances of EU Drinking Water Directive standards for total PFAS. These were BH2518 in the north and BH2526 in the south.                                                                                                                            |
| <b>Other Inorganics</b>                          |                |                     |                                       |                              |                              |                                                                                                                                                                                                                                                                                             |
| Ammoniacal Nitrogen (as N)                       | 34             | 0.29 (mg/l) [G2]    | 29                                    | 0.03                         | 22.01 (BH2522, July 2024)    | Exceedances of the GAC for ammoniacal nitrogen were recorded at each borehole location. Since 2023, notably elevated concentrations on or in the immediate vicinity of the site (i.e. >5 mg/l) have been localised to BH2513, BH2514, BH2517, BH2522 and BH2524 along the western boundary. |

| Contaminant                 | No. of Samples | GAC (µg/l)<br>[Source] | Number of Exceedances of GAC recorded | Minimum Concentration (µg/l) | Maximum Concentration (µg/l) | Distribution Comment                                                                                                                                                                                                                                                |
|-----------------------------|----------------|------------------------|---------------------------------------|------------------------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chloride                    | 34             | 188 (mg/l)<br>[G2]     | 2                                     | 5.1                          | 217.5 (BH2517, Oct 2024)     | No exceedances were recorded on-site. Exceedances were consistently recorded in BH2517 to the west of the site.                                                                                                                                                     |
| Nitrate as NO <sub>3</sub>  | 34             | 37.5 (mg/l)<br>[G2]    | 1                                     | <LoD                         | 45.2 (BH2526, July 2024)     | Only one location recorded an exceedance of the GAC for nitrate as NO <sub>3</sub> (BH2526) in the south of the site. However, no other exceedances have been recorded and the subsequent concentration in the October monitoring round was below the relevant GAC. |
| Sulphate as SO <sub>4</sub> | 34             | 188 (mg/l)<br>[G2]     | 7                                     | <LoD                         | 402.5 (BH2527, Oct 2024)     | Exceedances recorded on-site were located in BH2514, BH2516, 2518 BH2527. Off-site locations within 50m of the site with exceedances were BH2513 and BH2522.                                                                                                        |

The following criteria have been used to select GAC:

- G1 – Hazardous substances in groundwater for waterbodies at 'High' WFD status: UKTAG Technical Report on Groundwater Hazardous Substances Sept 2016 plus accompanying Confirmed Hazardous Substances List (January 2018) - Concentration in Groundwater Below Which Danger of Deterioration in Receiving Groundwater is Avoided
- G2 – Non-hazardous substances in groundwater and waterbodies not at 'High' WFD status: WFD Threshold Values (TVs) for 'Good' Status. The Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015GW1 - UKTAG Technical Report on Groundwater Hazardous Substances Sept 2016 plus accompanying Confirmed Hazardous Substances List (January 2018).
- G3 – The EU Drinking Water Directive standards (Directive 98/83/EC on the Quality of Water Intended for Human Consumption)
- G4 - World Health Organization (WHO) guide values for TPHCWG fractions in drinking water
- G5 – EC Technical Guidance for Deriving Environmental Quality Standard, Annual Average (AA) for inland waters.

### 3.3.1 Risks to Groundwater Receptors

Groundwater in the Secondary A and Principal Aquifers beneath the site and off-site are considered to be sensitive receptors. Elevated concentrations of inorganic contaminants, including ammoniacal nitrogen, sulphates, chloride, nitrate and metals including arsenic, boron and iron were recorded in groundwater samples above GAC. The concentrations of contaminants present in the south and north of the site are considered to be associated with the historic infilling that occurred on-site and off-site.

Elevated concentrations of the metals, arsenic and iron, were consistently recorded in the south. More sporadic exceedances of relevant GAC of metals including boron were recorded across the site, notably on and directly off-site to the north-west; no obvious trends were observable within these results. Metals are considered to be relatively immobile contaminants and the absence of exceedances of relevant GAC downgradient of known hotspots indicates that there is not significant lateral migration of metals within groundwater. Exceedances recorded for sulphate, chloride and nitrate are all considered to be marginal in comparison to EQS.

Notably elevated concentrations of ammoniacal nitrogen on or in the immediate vicinity of the site (i.e. >5 mg/l) have been localised to BH2513, BH2514, BH2517, BH2522 and BH2524 along the western boundary. The only location on-site with significantly elevated concentrations was BH2514, with a maximum concentration of 11.83 mg/l in July 2024 compared to the GAC of 0.29 mg/l. This is located along the north-west boundary, indicating that on-site migration of ammoniacal nitrogen from the wider landfill is likely not occurring. Furthermore, BH2513 which is downgradient and positioned to the north-west of the site consistently recorded lower concentrations than those in BH2514. Groundwater flow is to the east and flow off-site is expected to be limited by the low permeability alluvium deposits off-site to the east.

PFAS were detected in groundwater samples collected during all monitoring visits at very low concentrations, which is not unexpected given the ubiquitous nature of this contaminant in the environment. In Ramboll's experience the Environment Agency apply a value of 0.1 µg/l for each subset of PFAS compounds, which is based on the drinking water wholesomeness standard of 100ng/l. Concentrations of PFOS and PFHxS were encountered in excess of relevant GAC in BH2517 and BH2513, both of which are situated off-site to the west. Groundwater contour plots show that groundwater in these locations does not flow on-site limiting potential for on-site migration. In addition, no concentrations were detected above the GAC (<0.65ng/l) in the nearby on-site BH2520. One exceedance of total standard for PFPeA (0.1 µg/l) was recorded in BH2526 in the south of the site (0.37 µg/l) during the October 2024 monitoring round. It should be noted that the concentration was generally low and no other exceedances of PFPeA were detected during any of the other monitoring rounds.

Only two locations on-site recorded exceedances of EU Drinking Water Directive standards for total PFAS (0.5 µg/l). These were BH2518 in the north at a concentration of 0.52 µg/l and BH2526 in the south at a concentration of 1.5 µg/l. The total concentration of PFAS in BH2518 and 0.28 µg/l of BH2526 comprised PFBA, which is a short chain PFAS compound (i.e. with six or fewer perfluorinated carbons) and can be a breakdown product of other PFAS. It is not considered to be easily transformed/degraded by hydrolysis or photolysis in water to any appreciable extent and neither biodegradable under aerobic or anaerobic environmental conditions in water or soil. Short chain PFAS tend to be more soluble in water, than long chain PFAS, thereby having a higher potential for aqueous transport. However, the bioaccumulation potential of short-chain PFAAs is lower than that of long chain PFAAs. The site is not located in a drinking water zone.

Concentrations of PAHs above the GAC were noted to be most commonly present in BH2520; it is unclear if the concentrations relate to the Made ground at this location or the USTs. Whilst flow direction in the north of the site is generally inferred to the east, the lower permeability Alluvium in the north-east

extending off-site to the east is considered to be a mitigating factor in potential off-site lateral migration of residual contamination in groundwater.

No observable seasonal trend in the concentrations of contaminants was recorded in samples of groundwater, although exceedances were typically recorded in the same locations during all monitoring rounds.

Along the north-west site boundary groundwater typically flows in a more northerly direction, however, the presence of the Poyle Channel to the north is considered to limit hydraulic continuity with the off-site aquifer. Furthermore, the presence of reworked clay type Made Ground overlying the gravels present along the northern boundary is considered to limit permeability along the site boundary and a separate landfill is located to the north. The deeper chalk Principal Aquifer is considered to be protected from the downwards migration impacted groundwater by the presence of the underlying impermeable London Clay bedrock. Surface water impacts are assessed further in the risk assessment below.

No observable seasonal trend in the concentrations of contaminants was recorded in samples of groundwater, although exceedances of quality standards were typically recorded in the same locations during all monitoring rounds. However, no significant source-pathway-receptor relationships have been identified.

Table 3-2 Risks to the Surface Water Environment

| Contaminant                             | No. of Samples | GAC (µg/l)<br>[Source]            | Number of Exceedances of GAC recorded | Minimum Concentration (µg/l) | Maximum Concentration (µg/l) | Distribution Comment                                                                                                                                                                                                                                      |
|-----------------------------------------|----------------|-----------------------------------|---------------------------------------|------------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Metals</b>                           |                |                                   |                                       |                              |                              |                                                                                                                                                                                                                                                           |
| Arsenic                                 | 34             | 50 [S1]                           | 1                                     | <LoD                         | 51.9 (BH2526, July 2024)     | Only one exceedance of the GAC for arsenic was recorded in BH2526 in the south of the site during the July 2024 monitoring round. However, during the subsequent October 2024 monitoring round concentrations had dropped below the GAC exceedance level. |
| Boron                                   | 34             | 2000 [S1]                         | 1                                     | <LoD                         | 2,207 (BH2517, Oct 2024)     | One exceedances of boron was recorded in BH2517; no on-site borehole samples recorded significantly elevated concentrations.                                                                                                                              |
| Chromium (III)                          | 34             | 4.7 [S1]                          | 2                                     | <LoD                         | 8.9 (BH2516, Oct 2024)       | Two exceedances were recorded in the north of the site during the October 2024 monitoring round; these were located in BH2516 and BH2518. No other exceedances were recorded.                                                                             |
| Copper                                  | 34             | 6.81<br>[S1, EQS<br>bioavailable] | 4                                     | <LoD                         | 12.0 (BH2520, Oct 2024)      | Exceedances on site were recorded in BH2520 in the north of the site and BH2513 off-site to the north-west.                                                                                                                                               |
| Iron                                    | 34             | 1000 [S1]                         | 14                                    | <LoD                         | 29,807.3 (BH2526, Oct 2024)  | Exceedances of iron were recorded across the site and the wider landfill to the west. Notably higher concentrations were recorded in the south of the site (BH2525, BH2526 and BH2527).                                                                   |
| Lead                                    | 34             | 1.2<br>[S2, EQS<br>bioavailable]  | 1                                     | <LoD                         | 1.8 (BH2520, Oct 2024)       | Only one exceedance of the GAC for lead was recorded on-site in BH2520 during the October 2024 monitoring round. Concentrations of lead across the majority of samples were not recorded above the LOD.                                                   |

All others were situated off-site to the west. The most elevated reading was identified in BH2517 off-site to the west.    |
| <b>Other Inorganics</b>                          |                |                     |                                       |                              |                              |                                                                                                                                                                                                                                                                     |
| Ammoniacal Nitrogen                              | 34             | 0.6 (mg/l) [S1]     | 26                                    | 0.03 (mg/l)                  | 22.01 (BH2522, July 2024)    | Elevated concentrations on-site have been limited to BH2514, BH2516 and BH2518 in the north and BH2526 and BH2527 in the south. Off-site exceedances were recorded in BH2513 to the north-west and BH2517 and BH2522 to the west.                                   |
| 1,4-Dioxane                                      | 23             | 0.46 [S5]           | 3                                     | <LoD                         | 46.5 (BH2517, April 2024)    | Three locations recorded concentrations of 1,4-dioxane above EQS; these were BH2517 and BH2522 off-site to the west and BH2514, located in the north-west corner of the site. No exceedances were recorded during the following July and October monitoring rounds. |
| Sulphate as SO4                                  | 34             | 400 [S1]            | 1                                     | <LoD                         | 403.5 (BH2527, October 2024) | Exceedances on-site were localised to BH2527 in the south during the October 2024 monitoring round.                                                                                                                                                                 |

The following criteria have been used to select GAC:

S1 – Specific and other pollutants in surface water: The Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015 or where not available EA EQSs to be utilised in surface water risk assessments as part of environmental permit applications and WFD assessments of works in coastal and transitional waters in England.

S2 - Priority substances in surface water and selected (other determinands to which this policy relates): 2013/39/EU: Priority Substances in the Field of Water Policy Directive and 2008/105/EC: Environmental Quality Standards in the Field of Water Policy Directive

S3 - World Health Organization (WHO) guide values for TPHCWG fractions in drinking water

S4 – EC Technical Guidance for Deriving Environmental Quality Standard, Annual Average (AA) for inland waters

S5 - Tap Water standard for US Environmental Protection Agency (EPA) Regional Screening Levels

### 3.3.2 Surface Water Discussion

Exceedances in relation to surface waters typically followed trends observed throughout the groundwater screening. Ammoniacal nitrogen is considered to be the primary risk to surface water quality given the significantly elevated concentrations recorded and its widespread nature across the site. However, concentrations recorded in the downstream surface water sample of the Colne Brook were generally the same if not lower than upstream samples from the Poyle Channel and the Colne Brook, which were both notably low in concentration. This indicates that residual contamination in groundwater beneath the site is not migrating laterally into adjacent surface water features, and therefore a significant risk has not been identified.

With the exception of widespread iron exceedances, elevated concentrations of metals were generally sporadic across the site or located off-site within the wider landfill area. Exceedances of iron were not recorded in significant concentrations in any of the surface water samples tested.

No exceedances of aromatic or aliphatic TPH fractions were recorded on-site. Concentrations of PAHs were generally recorded across the site, with more locally elevated readings recorded in BH2520. Concentrations of the PAH benzo(a)pyrene, the most widespread PAH, were noted to be present in excess of GAC (0.00017 µg/l) in surface water samples taken from the Colne Brook and Poyle Channel. The highest concentrations were typically present in the upstream samples, such as the concentrations of 0.007 µg/l recorded in both locations compared to concentrations below the LoD in the downstream sample and the borehole positioned closest to the Poyle Channel (BH2513). This indicates that potentially residual contamination in groundwater beneath the site is not the source of elevated concentrations in nearby surface water receptors and that higher concentrations are likely reflective of the poor water quality of the region associated with surrounding land uses such as the nearby industrial estate, historic landfills and Heathrow Airport.

1,4-dioxane was recorded in three locations exceeding EQS from February 2024 to April 2024, although only one of these was located on-site in BH2514 in April 2024 (45.7 µg/l against an EQS of 0.46 µg/l), which is located along the north-west boundary; however, there were no correspondingly elevated concentrations of 1,4-dioxane in downstream samples and no exceedances of the surface water EQS were recorded from April onwards.

Concentrations of PFOS were recorded in BH2516 (0.0184 µg/l), BH2518 (0.0598 µg/l) and BH2520 (0.05 µg/l) in the north of the site and BH2526 (0.1 µg/l) in the south; the majority of recorded concentrations are considered to be marginal exceedances of the EQS protective of the surface water environment (0.00065 µg/l) and a significant 'high-risk' source of PFAS has not been identified on-site. Further, the PFOS EQS of 0.00065µg/l is based on protection of human health relating to the consumption of biota (i.e. fishery products). Further Quality Standards are set protective of the pelagic community receptors and then secondary predators of the pelagic community at 0.23µg/l and 0.002µg/l respectively, as set out in the EQS dossier for PFOS. Concentrations on-site were generally below the 0.23µg/l and above the 0.002µg/l standard. However, limited connection to surface water receptors has been identified as discussed below.

As stated previously given the difference in water level elevation between the Poyle Channel and the groundwater underlying the site, the two water bodies are likely not in significant continuity. Further, groundwater flow across much of the north of the site flows eastwards and not towards the Poyle Channel further indicating the lack of significant continuity. This along with the low permeable clay Made Ground/reworked Alluvium deposits along the northern boundary limit any potential interaction between the two waterbodies, which is reflected in the significantly lower concentrations of contaminants recorded in all surface water samples. Potential risks to surface water receptors to the west and south, including the Colne Brook and Wraysbury Reservoir, are considered to be limited given their distance from the site.

## 4. Ground Gas Risk Assessment

### 4.1 Ground Gas Monitoring Results

The ground gas assessment included in this report is provided for indicative purposes only and is not intended for use as a detailed ground gas risk assessment.

In order to further characterise the ground gas regime four monitoring rounds were carried out between February and October 2024. The number and frequency of monitoring rounds was based on guidance provided within CIRIA C655<sup>1</sup>. The ground gas monitoring results are provided in full in Appendix 4.

### 4.2 Results and Discussion

#### 4.2.1 Atmospheric Pressure

The lowest pressure recorded was 983mb in October 2024, whilst the highest atmospheric pressure recorded being 1022mb in April 2024.

#### 4.2.2 Flow Rates

The peak gas flow rate of 0.5 l/hr was recorded during October 2024 in BH2488 in the BESS area of the site. With the exception of two gas flow rates of 0.2 l/hr recorded in BH2496 off-site to the north-west in April and BH2501 in the north-east of the datacentre area in October all other flow rates recorded were of 0.1 l/hr or below the instrument detection level (<0.1 l/hr). All readings greater than 0.1 l/hr were recorded during periods of low pressure (between 983mb and 998mb).

#### 4.2.3 Methane and Carbon Dioxide

The highest encountered methane concentration on-site was 89.6% v/v recorded in BH2488 in the BESS area in July. The maximum concentration of methane in the north of the site was recorded in BH2514 at a concentration of 54.2% v/v in July.

The highest recorded carbon dioxide values recorded above the lower instrument detection limit on-site was recorded in BH2488 (10.3% v/v) the BESS area in July. The highest recorded concentration in the datacentre area was 7.3% v/v recorded in BH2501 in April. Readings were predominantly less than 10% v/v. The elevated concentrations are expected to relate to the variable nature of the infill material on-site.

#### 4.2.4 Oxygen

Minimum oxygen was measured in at a concentration of 0% v/v in three locations on-site throughout 2024; BH2488 in the BESS area and BH2488/BH2514 in the north-west of the site. resulting in 15 minimum values of 0% out of 61.

#### 4.2.5 Carbon Monoxide

The maximum recorded concentration was 21ppm in BH2488 in the south of the site in the February monitoring round. Only two locations in the north of the site recorded concentrations above the instrument detection limit (<1 ppm) BH2498 and BH2506, with respective readings of 2 ppm and 1ppm.

#### 4.2.6 Hydrogen Sulphide

The maximum concentration recorded was 35ppm in BH2488 in the BESS area in October 2024. Only three locations in the datacentre area of the site recorded concentrations above the

<sup>1</sup> Assessing risks posed by hazardous ground gases to buildings; CIRIA C665, 2007

instrument detection limit (<1 ppm), with maximum concentrations of 2 ppm recorded in BH2514 and BH2506.

#### 4.2.7 Volatile Organic Compounds (VOCs)

During the ground gas monitoring a photo-ionisation detector (PID) was used to screen for the potential presence of VOCs within the monitoring wells. The maximum was 28ppm recorded in BH2495 in July. The highest concentration recorded on-site was 0.5 ppm in BH2488 in the BESS area in the October monitoring round. Generally, concentrations recorded were below the instrument limit of detection (<0.1 ppm) or just above. In Ramboll's experience these readings are not significantly elevated and no soil or groundwater GAC exceedances attributable to vapour risks have been identified. No significantly elevated VOC concentrations were recorded within the vicinity of the decommissioned USTs.

### 4.3 Classification of Ground Gases

The risk posed by ground gases has been assessed by calculating a Gas Screening Value (GSV) based on a worst-case scenario of the maximum flow rate recorded in a given area and the maximum gas concentration (with individual GSVs calculated for both methane and carbon dioxide). The GSV has been calculated by multiplying the steady state flow rates and gas concentrations; as summarised in [Table 4-1](#). The GSV is used to support assessment of the site's characteristic situation (CS).

The site is to be developed as a datacentre and BESS and each area has been considered separately given the differing nature of the development and that the source potential is subtly different with the BESS area located fully on landfilled ground, whereas the datacentre is only partially located on ground classed as a landfill with the majority located on a mixed fill formed of reworked natural deposits and construction materials.

**Table 4-1 Ground Gas Assessment**

| Potential Source   | Maximum Flow Rate (l/hr) | CO <sub>2</sub>                   |            | CH <sub>4</sub>                   |            | Characteristic Situation |
|--------------------|--------------------------|-----------------------------------|------------|-----------------------------------|------------|--------------------------|
|                    |                          | Maximum Gas Concentration (% v/v) | GSV (l/hr) | Maximum Gas Concentration (% v/v) | GSV (l/hr) |                          |
| North (Datacentre) | 0.2                      | 7.3                               | 0.0144     | 54.2                              | 0.1084     | <b>2 – Low Risk</b>      |
| South (BESS)       | 0.5                      | 10.3                              | 0.0515     | 89.6                              | 0.448      | <b>2 – Low Risk</b>      |

Based on BS8485<sup>7</sup>

Based on a worst case GSV calculation the site is classified as 'Characteristic Situation 2' (CS2, that corresponds to a low hazard) in BS8485. Whilst elevated ground gas volumes were recorded flow rates at the same locations were not significantly high. As a result, only BH2488 in the south of the site corresponds to a CS2 classification, with all others corresponding with a CS1 classification. Despite this, given the elevated concentrations of methane (89.6% v/v) and carbon dioxide (10.3% v/v) recorded the site is considered to correspond to CS3 (moderate risk), which is typical of an old landfill.

The design of future buildings on site will need to take into account the findings of this gas risk assessment and will need to consider the incorporation of appropriate ground gas protection measures for the proposed use of the site. The requirement and design of gas protection measures will need to be implemented in line with guidance provided in BS8485, which includes consideration for the building's construction and use.

## 5. Conclusions

Ramboll has produced this Annual Groundwater Monitoring Report to assist in the proposed demolition of existing buildings and site re-levelling, erection of a building for use as a data centre, erection of a sub-station, a Battery Energy Storage System (BESS), as well as associated external works and utility infrastructure, site access works, internal circulation routes and landscaping at the Manor Farm site in Poyle, Slough. Information used to inform this assessment was obtained from quarterly monitoring visits undertaken between February and October 2024.

Evidence of residual contamination encountered was consistent with historic use of the south and the north-west of the site as a landfill and the north-east of the site for light industrial/commercial uses, which also resulted in infilling (as reworked construction and natural materials).

The presence of residual concentrations of contaminants including ammoniacal nitrogen, iron and petroleum hydrocarbons in groundwater is considered to be typical of a site subject to variable filling. Whilst there is contamination present the potential for this to represent a significant risk to wider groundwater or surface waters is considered to be limited. Petroleum hydrocarbon contamination identified locally close to the USTs in the north of the site is also considered to be associated with the presence of the now decommissioned diesel USTs; however, it is understood that below ground fuel infrastructure will be removed as part of the development.

Whilst exceedances of inorganic and organic contaminants were recorded in excess of relevant GAC or EQS protective of groundwater and surface water environments, the presence of low permeability clayey Made Ground/reworked alluvium deposits along the boundary is expected to act as a mitigating factor to off-site migration. Likewise, deposits of low permeability Alluvium in the east of the site are expected to limit lateral migration, which could potentially impact the off-site superficial aquifer. The deeper chalk aquifer is considered to be protected from vertical migration of impacted groundwater due to the presence of the underlying impermeable bedrock.

No exceedances of screening of groundwater samples against the GAC for a commercial/industrial development were encountered, indicating that a viable groundwater volatilisation source is not present beneath the site.

The difference in elevation between groundwater beneath the site and surface water levels within the adjacent Poyle Channel indicates that the two waterbodies are not in significant hydraulic continuity. In addition, no correspondingly increased concentrations of contaminants have been recorded in surface water samples taken from the Poyle Channel or Colne Brook. This indicates that contaminated groundwater beneath the site is not significantly interacting with nearby surface waters, and therefore no potential risk has been identified.

Ramboll's ground gas monitoring data recorded concentrations and flow rates consistent with a Characteristic Situation 2 classification; however, given elevated concentrations of methane and carbon dioxide it is recommended that the site be classified as CS3 (moderate risk) which is typical of old landfill sites. It would be prudent to undertake further investigation of the gas source beneath the datacentre building and to use continuous monitoring techniques to further assess using quantitative techniques the characteristic situation during the detailed design stage.

Identified contamination is considered to be manageable in the context of the proposed low sensitivity commercial use. Furthermore, the proposed development will improve the existing site conditions and remove obvious sources of contamination (e.g. underground storage tanks) during the works. The site is considered suitable for commercial development, however, further investigation to delineate areas of potential contamination and provide ground and groundwater information in areas of data gaps is recommended.
